Multi-Color Pen

What It Does: You can program a handheld or on-screen pen for changes of color as it writes. For example, you may set the change to occur after a set amount of writing done, or elapsed time in use or even a given color sequence.

Random Multiple Color Invention:

Art enthusiasts get extra fun when the device decides when to change colors. The pen varieties are connected to a base station, or computer. There are software and handheld versions. Multiple triggers can cause the automatic color changes. For example there can be a set amount of time between each color change.

The time may vary between colors based on, the current color being used; the amount of writing occurring with that color; etc. The invention is designed to inspire the artists, thereby having them purchase software for additional functions
